I've found that in some situations, it is necessary to remove a view controller from its parent view controller. I was thinking the only way to do this was to use `[self.parentViewController dismissModalViewControllerAnimated:YES];`. However, I've noticed a few cases where the same view controller is part of two views of the same parent. The view that has the modal view appears and disappears from the screen. It is then replaced with a new view controller. The new view controller is controlled by the same view controller that is in the parent. The view controller is removed from the parent and the new view controller is set as the new view controller. The app no longer recognizes that the view controller is a part of a view and deletes the view controller. It is not reapplied to the parent view controller. Is there another way to accomplish this type of view controller removal? A: When you remove a view controller from a navigation controller's stack, the system will remove all the views for that controller. If you want the old controller to still exist but be hidden, you can do: `// remove the controller // The container view will automatically be removed [self.navigationController popViewControllerAnimated:NO]; // unhide the view, probably [self.view insertSubview:self.containerView belowSubview:self.view];` Or when you change the view controller, you can still reuse it if you put it in a reusable navigation controller and use the managed object context to store the data for the current view controller instead of creating a new one. Q: User inputs infinite loop of words How do I make a program that puts the user's word in a text file. And then at the end, have a prompt where the user can type any word and the program will continue to put it
